Simple Screenreader

Talking Spell Checker

Keyboard and Mouse Controls

Realvoice Speech Synthesis

What Our Customers Say...

"I recently purchased Aurora 3.0 for my daughter. When I went down to install the software for her, I found her sitting at the computer using Aurora's word prediction to compose email using whole words rather than abbreviations. She had installed it herself and she had a smile from ear to ear. Thank you so much."

"I have owned my copy of Aurora for Windows for about a year now. It is hard for me to say what a great experience using your product has been for me. I had tried a few other products but I found all of them far less accurate than the Aurora system. Thank-you very much for all the work you have done. I wish you continued success. "

And so much more!

Augmentative Communication
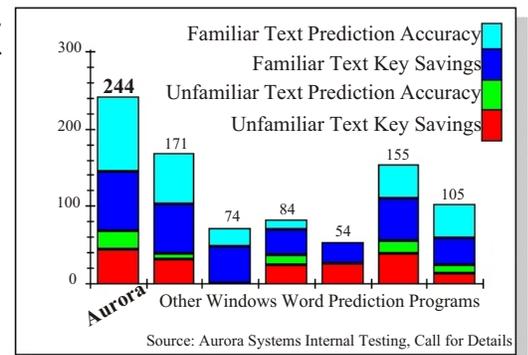

Word Prediction Helps you Type

Aurora Word Prediction **increases your typing speed** or lets you **type longer** before tiring by trying to guess what you are typing and completing words for you. Its **advanced statistical and grammatical algorithms** enabled it to save more keystrokes than any other program in a recent comparison.

Aurora is the first to implement huge vocabularies (**100,000+ words** including more than 20,000 names and places) which virtually guarantee that any word you might like to write will be in the dictionary. That means **keystroke savings**. And with a capacity of more than a million words, you can add as many words as you like.

For **younger users**, you can strip the vocabulary down to just the basics or even down to nothing so you can work together with them to build their vocabulary. Aurora also offers help with word selection through usage examples and definitions for troublesome words.
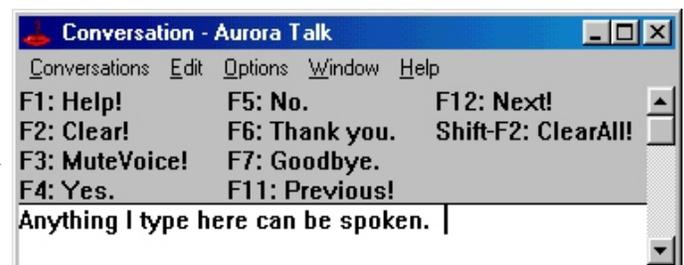

Abbreviation Expansion Speeds Repeated Phrases

Abbreviation Expansion is included in Aurora Prediction, for **text**, for **spoken messages** and to play **.WAV sound files**. Type in a short code, and out comes the expansion. You can easily add abbreviations, **as many as you like**, with expansions as long as you like (up to about 1000 characters.) And abbreviation codes are predicted so that if you have trouble remembering them, they will show up in the prediction window to cue you.

Talk to People Quickly and Easily

For conversational speech output, our Talk program allows you to type a phrase and have it spoken **without interrupting your work** in other applications. And it saves what you have written from day to day so that you **never have to retype phrases**. You can even group your phrases into topical conversations. For faster speech output, you can assign phrases to **function keys**.

Public Speaking is a Breeze

Aurora Talk really streamlines public speaking. If you write your presentation ahead of time, you can easily **import your presentation into Talk**, one sentence per line so you can easily control the rate of your presentation. If you get questions during your presentation you can **answer simple questions** with function key phrases, or go to a separate conversation to compose a **more comprehensive response**. Once the audience is satisfied, you are back into your presentation with a single keystroke.

Make Any Word Processor Talk

Aurora Echo's Toolbar provides **verbal feedback as you type**. It can echo letters, words, sentences and paragraphs as you type, as well as read back sections of text from **any word processor document** or icons and menus from the screen. Aurora Echo makes any Windows word processor a talking word processor. Since you hear what you have typed, you can be sure that what you typed is what you meant. It can also **read email and web pages**. Echo is also great for helping you check your documents.

Phonetic Spelling - Spell Like You Hear

Phonetic spelling can often offer the correct word in the prediction window **even when you've spelled it wrong**, so if you typed "ensyclopedia", you would be offered "encyclopedia" in the prediction window in blue so you can instantly distinguish them from correctly spelled words.

Aurora 3 For Windows

Speech Output Included

Aurora for Windows supports many speech synthesizers including Microsoft SAPI and the included Aurora RealVoice. Aurora includes an easy to use **pronunciation correction** system to make sure that your synthesizer always pronounces words correctly.
